Caution urged over horse mackerel quota

The Responsible Fisheries Alliance is calling on the Department of Agriculture, Forestry and Fisheries to reconsider the recent decision to allocate an additional 8,000 tonnes of experimental quota in the horse mackerel fishery.

AGRICULTURAL NEWS - The Responsible Fisheries Alliance (RFA) is calling on the Department of Agriculture, Forestry and Fisheries (DAFF) to reconsider the recent decision to allocate an additional 8,000 tonnes of experimental quota in the horse mackerel fishery.

The RFA is a partnership between environmental NGOs WWF South Africa and BirdLife South Africa, and five major fishing companies, namely Irvin & Johnson (I&J), Oceana Group, Pioneer Fishing, Sea Harvest, and Viking Fishing,

current indications suggest that there is a need for a cautionary approach with regards to the horse mackerel resource.

Catch per unit effort (a standardised measure for measuring fisheries) has been unexpectedly low since 2014 with the reasons for this dramatic drop in catches still unclear. Due to this decline in resource availability, of the 58,000 tonnes of allowable catch in 2015, only 12,433 tonnes were caught across all sectors. This resulted in the species being downgraded to "Orange" on WWF's Southern African Sustainable Initiative (SASSI) list.

No research done

While the RFA says it is supportive of the department's efforts to identify additional socio-economic opportunities in the fisheries sector, it believes this must be done within the constraints of ecologically sustainable and precautionary limits, as prescribed by the Marine Living Resources Act.

To date, no research has been done to suggest that additional horse mackerel could be sustainably harvested in this fishery, nor has there been an explanation provided by the department as to the objective, approach, specifications or restrictions of the proposed experiment.

At present the experimental right is also not subject to the effort restrictions that have been placed on the existing rights-holders as a result of concerns around the status of the resource.

Given the uncertainty surrounding the status of this resource, responsible fisheries management requires that we employ a precautionary approach to manage this valuable fishery.

The allocation of an additional 8,000 tonnes, over and above the current total allowable catch and without any effort limitations, is irrational and threatens not just the ecological status of the fishery but the livelihoods of those who are involved in the fishery at present, says the RFA.
